We have been engaged in research and development in the field of organic chemistry since our founding in 1947. We have dedicated ourselves to manufacturing high-quality products in the food, pharmaceutical and industrial products fields, with the sole purpose of fulfilling our mission to create products that are a pleasure to use.

We don't merely develop our own products, but also emphasize custom production and custom manufacturing to ensure customers a reliable supply of products that meet their needs. YUKI is the link to your bold future with our lineup ranging from unique high value-added products to highly-versatile products such as glycine, which was originally developed by us.

About YUKI

Enriching people's lives through products using chemical technology

YUKI manufactures and continuously supplies products in the food, pharmaceutical and industrial products fields. We support you and your future through common daily foods in many situation in everyday life.

Glycine is known as a safe preservative which is used to make food last longer and delay spoiling, as well as a flavor enhancer. We were the first company in Japan to start manufacturing and marketing glycine in 1952. The technology for producing glycine and other amino acids is one of our key technologies. We are an established supplier of glycine to markets both in Japan and abroad.

The first to commercialize glycine in Japan

Growing and developing in tandem with the food industry

We commenced manufacturing and marketing glycine as a taste component for synthetic sake in 1952 for the first time in Japan. Since then, glycine has been used over many years as a preservative to make food last longer and delay spoiling, as well as a flavor enhancer for a wide variety of foods.

One of the largest glycine facilities in the world

We focus on improving quality and ensuring safety

Enriching

Lives

Protecting

Health

Our glycine manufacturing facility is one of the largest in the world. Our efforts are focused not only on improving quality and assuring safety but also ensuring that the standards for quality control are as high as for pharmaceuticals. We are an established supplier of glycine manufactured under our strictly controlled manufacturing system both to domestic and overseas markets.

Main products : glycine, glycine formulations, nicotinamide Major applications : shelf life extension of foods (e.g. rice balls, prepared foods, pastries), flavor enhancement (e.g. pickles, instant noodles)

Creating the Future

Expansion into new markets

Responding to changes in people's lifestyles

The development of supplements and functional foods in response to increased health awareness has been remarkable, with their number and variety increasing significantly. We are developing products that reflect changing lifestyles.

Health

Protecting health with products that meet strict international quality standards

Our products meet the requirements of Japanese pharmaceutical legislation and have passed audits by the US FDA and UK MHRA, ensuring world-class quality.

We are engaged in custom manufacturing of APIs and pharmaceutical intermediates for new pharmaceuticals and generics. We also market our own APIs and are ready to meet customer needs flexibly.

Industrial Products

In the rapidly advancing field of industrial products we support various industries, by manufacturing raw materials for industrial functional materials such as semiconductors and silicon wafers.

We also supply high-quality raw materials for manufacturing agricultural chemicals produced with concern for human health and the environment.

Products that meet international quality standards

Manufacturing products that are safe and comply with national standards

Our products are manufactured in compliance with GMP and the latest regulations. The quality of our products complies with the Japanese Pharmaceutical legislation and has been successfully audited by the US FDA and the UK MHRA. We guarantee the highest quality and safety standards.

pharmaceuticals

Using high technology to meet customer needs

In custom manufacturing of APIs and intermediates for new pharmaceuticals and generics, we meet diverse customer needs by establishing the manufacturing process in our research department, manufacturing using cutting-edge facilities, and applying a quality assurance system that meets international standards.

Major products : APIs (glycine, isoniazid, protamine sulfate, etc.), pharmaceutical intermediates, cosmetic ingredients Major applications : infusion preparations, antiviral ophthalmic solutions, anti-heparin agents, anti-tuberculosis agents, expectorant agents

Our products support people's lives in various areas

The organosilicon compounds that our company manufactures are used in manufacturing semiconductors and as starting materials for underwater hull paints. Our pyridine derivatives are used as the main ingredient in tire cord adhesives, and amino acid derivatives as chelating agents for industrial use.

Contributing to the development of an information society

electronic materials

Main products : organosilicon compounds, pyridine derivatives, amino acid derivatives Major applications : electronic materials; raw materials for paints, synthetic resins, and tires; industrial chelating agents; raw materials for agricultural chemicals

Custom manufacturing of

Global expansion of our proprietary products

Contributing to people's health through products developed by our company

APIs that we have developed include protamine sulfate, an anti-heparin agent; isoniazid, an anti-tuberculosis agent; and trifluorothymidine, an antiviral ophthalmic solution. We contribute to improving people's health through manufacturing and marketing these ingredients.

Applying our technology to

The manufacturing of semiconductors and electronic devices requires strict control. Based on our experience in developing and manufacturing foods and pharmaceuticals, we have harmonized product development and manufacturing to meet the rigorous standards of semiconductor and other manufacturers.

Protecting the ecosystem and the environment

Continuing to protect people's health, the ecosystem and natural beauty for the future

We manufacture starting materials and intermediates for agricultural chemicals produced with concern for human health and the environment. We have raised our efforts to conserve the environment in all manufacturing processes and support our customers' CSR activities by supplying environmentally friendly chemical products.

Contributing to the Future in Three Areas The Craft of Manufacturing at YUKI

Our company started with researchers synthesizing tobacco flavors in a university laboratory. The founders' hope of making chemical technology useful for everyone has been passed on to all YUKI employees. In the spirit of this hope, staff members in Sales, Basic Technology Research, Mass Production Technology Research, Manufacturing, and Quality Assurance and Control cooperate with each other based on their experience and expertise in order to contribute to the future in YUKI's food, pharmaceutical and industrial products fields.

The Craft of Manufacturing at YUKI

Sales

Linking customers and manufacturing to shape the future

Professionals from three product categories who are familiar with product development and the production system are ready to respond to customers' needs. We offer support to customers in many markets around the world.

Mobile staff structure helps identify customer needs quickly and accurately

Professionals from the Food product category, Industrial Chemicals product category, and Pharmaceuticals product category are responsible for different regions. We are ready to respond dynamically and effectively to increasingly diverse demands.

Specialists that understand product development

Many of our sales staff have experience in research and development. Staff with product expertise listen closely to customers and consult them to meet their needs. Through close cooperation with staff in charge of research and manufacturing, sales staff can respond flexibly to custom manufacturing requests.

Food

This category is concerned with amino acids, especially glycine and β -alanine. Glycine, which has become synonymous with our company, is a product which is sold extensively, mainly for use in the food industry.

Industrial Chemicals

This category mainly deals with pyridine derivatives resins, semiconductors, etc.), and offers custom manufacturing services.

From the Factory Floor

Sales staff thoroughly familiar with the manufacturing facilities provide full support for custom manufacturing

Many members of the sales staff have experience as researchers. I worked in the Research Laboratory before being assigned to sales. Our hands-on experience and knowledge regarding research and manufacturing allow us to offer support in close cooperation with various departments to ensure a smooth transition from manufacturing to delivery of products that meet customers' needs. Particularly with regard to custom manufacturing, a researcher's perspective enables us to propose the most suitable manufacturing processes that meet legal regulations. You can rely on our staff, who have decades of experience in providing numerous products throughout the world.

Information support on pharmaceutical and other issues in different countries

Our sales staff are specialists that help meet strict standards and testing requirements, especially for food and pharmaceuticals, as well as helping to supply products around the world. We have a support system in place providing information and compliance support services for various national regulations as part of a wide palette of support services.

(used in tires, agricultural chemicals, pharmaceuticals, etc.) and organosilicon compounds (used in synthetic

Pharmaceuticals

This category deals with API's and pharmaceutical intermediates and the development of new products with a focus on the healthcare field. The division helps meet the strict standards of different countries around the world in custom manufacturing. Emphasis is also placed on generic APIs.

The Craft of Manufacturing at YUKI

Basic Technology Research (Tokyo Research Laboratory)

The Craft of Manufacturing at YUKI

Mass Production Technology Research (Joban Factory)

Proposing optimal manufacturing processes and products

The Research Laboratory is mainly engaged in the development of technologies unique to our company and preparing the basic design for custom manufacturing. In custom manufacturing, our system allows us to respond to customer requests precisely and in a timely manner.

Taking advantage of technology development capabilities unique to our company to develop and offer new products

We use our own technologies effectively to develop new products with unique characteristics, such as pyridine and piperidine compounds, organosilicon compounds, amino acid derivatives, and nucleic-acid derivatives. We supply chemical compounds such as pharmaceuticals, pharmaceutical intermediates, paints and polymeric materials that have been developed by our company for a wide variety of fields, ranging from the pharmaceutical industry to the electronics industry.

Designing manufacturing processes that meet legal requirements

Our dedicated staff gather and analyze information on products desired by each customer, as well as information on what legal requirements need to be met. Tokyo Research Laboratory swiftly performs scale-up from small laboratory trials to pilot manufacturing. We make the most suitable proposals for fulfilling customer needs, based on technologies accumulated over the years.

Achieving high quality through meticulous analysis

We analyze the structures of trace impurities and crystal polymorphs using a variety of high-performance analytical equipment such as NMR, GC/MS, LC/MS, powder X-ray diffractometer and SEM. Based on the analysis results, manufacturing processes that ensure high quality are developed.

<Principal Analytical Equipment>

NMR, IR, GC, GC/MS, HPLC, UPLC, LC/MS, atomic absorption spectrometer, thermal analyzer, refractometer, UV-VIS, polarimeter, colorimeter, ion chromatograph, amino acid analyzer

From the Factory Floor

Preparing products that are safe and reliable efficiently according to a plan that is tailored to your company needs

In response to customer needs, Tokyo Research Laboratory's activities include carrying out scientific surveys, and range from laboratory trials of several grams up to manufacturing with experimental facilities on the scale of dozens of kilograms. The manufacturing process is always designed in close cooperation with Quality Assurance and Quality Control, which are responsible for issues related to patents and applications. To achieve commercialization that meets international standards, we present an efficient plan that has been optimized for the customer.

Ensuring successful scale-up to mass production

To achieve mass production, we identify the best manufacturing method with respect to the product characteristics and conduct research and development that leads to tangible results. In the pharmaceutical field, we also provide services that meet customer needs, such as compliance with GMP.

Trial manufacturing on the actual manufacturing equipment to support production

The Manufacturing Technology Department located within the Joban Factory develops, in cooperation with manufacturing staff, manufacturing methods that ensure quality improvement and production stability in the run up to mass production. We use the actual manufacturing equipment from the trial manufacturing stage to verify scale-up procedures and after establishing a mass production system, we continue our improvement efforts in pursuit of a more efficient and stable production system.

Accumulating and applying industrial technology

Our company has accumulated industrial technology and know-how, including hydrogenation reactions using organometallic reagents such as Grignard reagents and transition metal catalysts. We use such technologies to commercialize not only pharmaceuticals but also rapidly changing electronics-related materials, functional materials, and polymer-related materials

<Principal Analytical Equipment>

SEM, ICP, powder X-ray diffractometer, GC, GC/MS, HPLC, atomic absorption spectrometer, ion chromatograph, particle size analyzer, specific surface area meter, thermal analyzer

From the Factory Floor

Applying advanced technology for transition to mass production to enable large scale production even when scale-up of the manufacturing process is difficult

After assessing scale-up to mass production of a new product developed at the Tokyo Research Laboratory, the product is manufactured at the Joban Factory. To prevent possible problems, especially when starting mass production of a newly launched product or a product that is handled for the first time, thorough, repeated assessments are made before scaling up and strict risk management is implemented. In addition to opinion sharing and collaboration within the Joban Factory, we cooperate closely with the Tokyo Research Laboratory to facilitate efficient transition to large-scale production. As a staff member responsible for scaling up, I also monitor production at the factory.

Meeting modern needs with rapid development

Product life cycles in the market are getting shorter. It is therefore essential to deliver better products to customers guickly. At the factory, we cooperate with the basic technology research department and the manufacturing department to achieve a smooth transition to mass production, while prioritizing rapid research and development.

The Craft of Manufacturing at YUKI

_ _ _ _

Manufacturing Site (Joban Factory)

The Craft of Manufacturing at YUKI

Quality Assurance and Control (Joban Factory, Head Office)

Never missing the slightest change in order to assure stable production

The Joban Factory is our company's primary manufacturing site for amino acids, APIs, industrial chemicals and other products. A variety of products, ranging from general-purpose products to high value-added products, are manufactured with highperformance manufacturing facilities under an efficient production system.

Manufacturing facilities for pharmaceutical and chemical products

API manufacturing in compliance with strict international quality standards

APIs such as isoniazid, protamine sulfate and trifluorothymidine, are produced using GMP-compliant cutting-edge facilities, under a process control system that complies with the standards of Japan, the United States and Europe

Custom manufacturing that meets diverse needs

Our manufacturing facilities can handle many kinds of reactions, which allow us to offer custom manufacturing services that meet a variety of customer needs.

From the Factory Floor

Ensuring stable product supply as well as pursuing high quality and low cost

It is essential for the factory to ensure a steady supply of products to the market. In addition to operation of the factory to manufacture products, it is also our task to pursue high product quality and low costs. I cooperate with other members at the worksite to operate large-scale facilities in order to mass produce products. We are required to carry out assigned work safely and accurately according to predetermined procedures. Furthermore, individual members are active in taking measures to make manufacturing more efficient by, for example, identifying methods that are more efficient in our daily activities in manufacturing processes and making proposals for improvement if necessary.

Manufacturing facilities for amino acids (glycine and β-alanine)

Amino acid manufacturing trusted by customers in

Our company's glycine manufacturing started with organic synthesis

research at the University of Tokyo in 1951. We have been supplying

high-quality glycine for many years, not only in Japan but also

around the world. This manufacturing process is also applied to the manufacture of β -alanine, which is used as an ingredient in vitamins.

Manufacturing system that ensures a stable supply

Various manufacturing facilities, including one of the largest facilities

for glycine manufacturing in the world are operated effectively under

central control, with the highest priority placed on safety.

Japan and abroad

Supporting the manufacture of world-class quality products

One of the most important responsibilities for manufacturers is product quality assurance and quality control. Our Quality Assurance Division is independent of manufacturing in order to maintain a quality management system that meets international requirements.

Pursuing high quality and guaranteeing safety

The quality of our pharmaceuticals meets Japanese requirements as well as the US FDA's and the EU's requirements. We have adopted the ISO 9001 Quality Management System since 1998, and in 2021, we acquired FSSC 22000 certification, an international scheme for Food Safety Management Systems, to improve and enhance the quality assurance and control system.

From the Factory Floor

Assuring product quality as a professional analytical chemist

I inspect products before shipment. Our company offers many types of products, and therefore, abundant data on them that has been obtained from tests and examinations is available. We perform a thorough final inspection to ensure the quality of each product. In order to verify and ensure product quality, we conduct various kinds of tests and examinations.

Environmental efforts

To be "a company that coexists with nature in harmony and that is environmentally friendly," we are active in environmental conservation. We have adopted the ISO 14001 Environmental Management System since July 1997.

Water pollution

The Quality Assurance Division helps to ensure that products meet international standards

We are responsible for all internal activities involving product quality (GMP and ISO). Our company supplies products that are safe and meet the strict standards of different countries, by incorporating the latest information and at the same time taking advantage of our abundant experience in custom manufacturing over many years.

Industrial wastewater from the factory is discharged into public waters only after being purified with equipmer for activated sludge treatment.

Air pollution

We have adopted a small-sized once-through boiler to achieve energy saving and prevent air pollution

Waste reduction and recycling

We use our own liquid waste incineration facilities as well as external waste treatment se to treat and recycle waste.

Meeting customer needs with our expertise and specialized facilities

Custom Manufacturing

We offer custom manufacturing services for a variety of products, from general-purpose products to high value-added products. With regard to pharmaceuticals, we supply highly reliable products manufactured under our GMPcompliant quality assurance system.

BCP Advantages O Avoidance of capital investment of Custom Cost saving in manufacturing Manufacturing) Effective use of human resources

Custom Manufacturing of **Chemical Products**

Our system is designed to meet various custom manufacturing needs. We supply highly reliable products under a unique quality assurance system.

Our Strengths

We first produce a small volume of products on a trial basis, and based on the customer's assessment of the prototype, identify where to improve. We then consider and draw up a plan for mass production and commercialization. Based on the plan, we prepare for large-scale production using a highly efficient manufacturing method. After receiving approval for the plan from the customer, we sign a contract agreement and start high-quality mass production.

Flow of Custom Manufacturing

Major manufacturing technology

Grignard reaction, esterification, alkylation, alkoxylation, acylation, amination, amidation, diazotization, condensation reactions, reductions, etc. *We identify the optimal manufacturing method and manufacture products on a commercial scale under a quality control system that complies with ISO 9000.

Custom **Manufacturing of Pharmaceuticals**

There are various regulations on pharmaceutical development and manufacturing both in Japan and elsewhere. Based on our experience, we provide our customers with extensive support, supplying them with highly reliable products under our GMP-compliant quality assurance system.

Our Strengths

Development, manufacturing and commercialization in compliance with GMP standards

Over many years we have been engaged in the development of pharmaceutical intermediates, new pharmaceuticals and generics. As a partner to our customers, we provide custom manufacturing services that take advantage of decades of experience as well as continuing support of products that have already been commercialized.

Supplying to over 70 countries and global expansion

Various regulations on pharmaceutical development and manufacturing have been formulated both in Japan and abroad. With our knowledge of the regulatory requirements of different countries and marketing know-how accumulated over many years of experience, we supply APIs to more than 70 countries around the world.

2022		Changed to the Standard Market of the Tokyo Stock Exchange

Message from the President

YUKI GOSEI KOGYO has adopted since its founding a corporate philosophy of "We are dedicated to providing products of the highest value to people by implementing innovative solutions." and has supplied safe and reliable products to people around the world through the development, manufacture, and sale of unique and valuable products that are based on state-of-the-art organic synthesis. The Company was founded in 1947 as a chemical manufacturer based on advanced science and technology, beginning with the industrialization of naturally derived sweetening fragrances. Then, while Japan was in the midst of its postwar reconstruction, the Company expanded its business in the three fields of specialty chemicals, amino acids and pharmaceuticals, offering a variety of products to a broad range of different industries.

In recent years, we have carried out structural reforms in our historic amino acid business to ensure sustainable supply chains. We have also been expanding our portfolio of healthcare-related products, mainly pharmaceuticals, while focusing on the development of new products. In this way, we have established a well-balanced business structure in the three fields of amino acids, specialty chemicals and pharmaceuticals, and achieved our targets under the previous medium-term business plan, which started in 2020. In order to further strengthen the business foundation established under the previous medium-term business plan, we have formulated a new three-year medium-term business plan starting in 2023, and will strive to increase our corporate value with a goal of 15 billion yen annual turnover. One of the key initiatives in this medium-term business plan is to "foster a quality culture." We aim to improve not only product quality but also the quality of working life of our employees, by enhancing individual beliefs, behaviors and skills, as well as the quality of operation procedures, thereby increasing our earning capacity. As this improvement in human capital efficiency was successful in the previous medium-term business plan, we will continue to work on it in a more in-depth manner. The other key initiatives are as follows: Enhancement of corporate value; Restructuring the amino acid business; Broadening the pharmaceutical contract manufacturing business; Expanding and restructuring the chemical product business. These initiatives are aimed at achieving the basic policy of the new medium-term business plan, "In a rapidly changing economic environment, while expanding sales of key products, we will continue to introduce new products and lay the foundation for growth over the next 10 years." Through this medium-term business plan, the Company aims to become a highly profitable company.

Meanwhile, in the pursuit of sustainability, we have continued to invest in measures to reduce CO2 emissions. However, there are limits to further CO2 reductions as we expand our business, so we have started testing carbon-neutral fuels as a new initiative.

YUKI GOSEI KOGYO is fully committed to responding to the expectations and trust of its stakeholders, by ensuring the supply of products that help people to live healthier and enjoy more prosperous lives, and by protecting the environment for future generations, but also by increasing profits and actively contributing to a sustainable society.

We look forward to your continued support.

June 2023 YUKI GOSEI KOGYO CO., LTD. President & CEO

S. Matsurolo

Corporate Philosophy

We are dedicated to providing products of the highest value to people by implementing innovative solutions.
